## LFE Solutions Introduces Wattstopper Wireless Controls Solutions!

## Article

LFE Solutions is pleased to introduce WCG (Wireless Controls Group) to NAESCO member companies. Read this introduction from WCG;

Wireless Controls Group offers a complete line of wireless control solutions which fills a unique niche in building automation and energy conservation. The patented products encompass inside and outside lighting, HVAC, advanced metering and various other building automations requirements. We utilize the Tridium Jace in combination with the Niagara platform and Sedona language. Because of its open protocol it is quickly becoming the preferred choice of the US government as well as major corporations.

The products are broken down into 3 categories – lighting, controls and long range devices. The BULIT (Basic Utility Light Intelligent Transceiver) installs as a NEMA twist-lock photo sensor in outdoor lighting and then, due to its onboard CTs, reads watts, volts and amps in real time. The controllers are designed to integrate with most BAS systems. The long range devices are designed to wirelessly transfer point-to-point BAC Net, Lon Net, Mod Bus or Ethernet up to 10 miles. One of the many uses for these devices is metering and sub-metering within a building or complex, military base or community.

Our customer base includes Westfield Malls, Sea World, Jefferson Labs, Fort Benning, Fort Bragg, and Fort Hood, Charleston Air Force base, Busch Gardens, SAIC, Stor-All storage facilities, Nestle' Purina, Macerich Malls and more. WCI is on the approved US Army Flat Spec. as the only approved wireless supplier.
